

## 3.3 Increasing and decreasing functions

### Definition

Let  $f$  be a function on an interval  $I$ .

- ①  $f$  is **increasing** on  $I$  if  $f(a) \leq f(b)$  for every  $a < b$  in  $I$ .
- ②  $f$  is **decreasing** on  $I$  if  $f(a) \geq f(b)$  for every  $a < b$  in  $I$ .

We say that  $f$  is *strictly increasing* (or *strictly decreasing*) on  $I$  if the inequalities are strict.

### Theorem

Let  $f$  be continuous on  $[a, b]$  and differentiable on  $(a, b)$ .

- ① If  $f'(c) > 0$  for every  $c$  in  $(a, b)$ , then  $f$  is increasing on  $[a, b]$ .
- ② If  $f'(c) < 0$  for every  $c$  in  $(a, b)$ , then  $f$  is decreasing on  $[a, b]$ .
- ③ If  $f'(c) = 0$  for every  $c$  in  $(a, b)$ , then  $f$  is constant on  $[a, b]$ .

## 3.3 Increasing and decreasing functions

### Remark

*Finding intervals on which  $f$  is increasing or decreasing*

Let  $f$  be a differentiable function on an interval  $I$ . To find intervals on which  $f$  is increasing or decreasing:

- ① Find the critical values of  $f$ ; that is, the  $c$  in  $I$  where either  $f'(c) = 0$  or  $f'(c)$  is undefined.
- ② Use the critical values to divide  $I$  into subintervals.
- ③ Pick any point  $p$  in each subinterval, and find the sign of  $f'(p)$ .
  - a. If  $f'(p) > 0$ , then  $f$  is increasing on that subinterval.
  - b. If  $f'(p) < 0$ , then  $f$  is decreasing on that subinterval.

## 3.3 Increasing and decreasing functions

### Example

Find the intervals on which  $f(x) = \frac{x^2+15}{x-1}$  is increasing and the intervals on which it is decreasing.

- $f$  is increasing on \_\_\_\_\_
- $f$  is decreasing on \_\_\_\_\_

### Theorem

#### *First Derivative Test*

Let  $f$  be differentiable on  $I$  and let  $c$  be a critical number in  $I$ .

- ① If the sign of  $f'$  switches from positive to negative at  $c$ , then  $f(c)$  is a relative maximum of  $f$ .
- ② If the sign of  $f'$  switches from negative to positive at  $c$ , then  $f(c)$  is a relative minimum of  $f$ .
- ③ If the sign of  $f'$  does not change at  $c$ , then  $f(c)$  is not a relative minimum or relative maximum of  $f$ .

## 3.3 Increasing and decreasing functions

### Example

Find the intervals on which  $f(x) = \frac{x^2+15}{x-1}$  is increasing and the intervals on which it is decreasing.

- $f$  is increasing on  $(-\infty, -3) \cup (5, \infty)$
- $f$  is decreasing on  $(-3, 5)$

### Theorem

#### *First Derivative Test*

Let  $f$  be differentiable on  $I$  and let  $c$  be a critical number in  $I$ .

- ① If the sign of  $f'$  switches from positive to negative at  $c$ , then  $f(c)$  is a relative maximum of  $f$ .
- ② If the sign of  $f'$  switches from negative to positive at  $c$ , then  $f(c)$  is a relative minimum of  $f$ .
- ③ If the sign of  $f'$  does not change at  $c$ , then  $f(c)$  is not a relative minimum or relative maximum of  $f$ .

## 3.3 Increasing and decreasing functions

### Example

- Find and classify the critical points of  $f(x) = \frac{x^2+15}{x-1}$ .  
Local minima \_\_\_\_\_  
Local maxima \_\_\_\_\_  
Neither \_\_\_\_\_
- Find and classify the critical points of  $f(x) = \frac{(x-2)^{2/3}}{x}$ .  
Local minima \_\_\_\_\_  
Local maxima \_\_\_\_\_  
Neither \_\_\_\_\_
- Find and classify the critical points of  $f(x) = \sin x \cos x$  on  $(-\pi, \pi)$ .  
Local minima \_\_\_\_\_  
Local maxima \_\_\_\_\_  
Neither \_\_\_\_\_

## 3.3 Increasing and decreasing functions

### Example

- Find and classify the critical points of  $f(x) = \frac{x^2+15}{x-1}$ .  
Local minima  $f(5) = 10$   
Local maxima  $f(-3) = -6$   
Neither  $x = 1$
- Find and classify the critical points of  $f(x) = \frac{(x-2)^{2/3}}{x}$ .  
Local minima  $f(2) = 0$   
Local maxima  $f(6) = 4^{2/3}/6$   
Neither  $x = 0$
- Find and classify the critical points of  $f(x) = \sin x \cos x$  on  $(-\pi, \pi)$ .  
Local minima  $f(-3\pi/4) = f(\pi/4) = 1/2$   
Local maxima  $f(-\pi/4) = f(3\pi/4) = -1/2$   
Neither *none*

## 3.3 Increasing and decreasing functions

Just checking. . . .

- 1 Find and classify the critical points of  $f(x) = 2x^3 + x^2 - x + 3$ .
- 2 Find the value of  $c$  in  $(-1, 2)$  where the instantaneous rate of change in  $f(x) = x^2 - 3x + 5$  at  $c$  is equal to the average rate of change in  $f$  over  $[-1, 2]$ .
- 3 Evaluate  $\lim_{x \rightarrow 5} \frac{x/5 - 5/x}{x - 5}$ .
- 4 Using an  $\varepsilon - \delta$  argument, show that  $\lim_{x \rightarrow 2} 3x^2 = 12$ .
- 5 Find the points on  $x^2 - xy + y^2 = 1$  where the tangent line is horizontal and where it is vertical.

## 3.4 Concavity and the second derivative

### Definition

The graph of a function  $f$  on an interval

- is **concave up** if it lies above its tangent lines
- is **concave down** if it lies below its tangent lines
- has no concavity if it is flat (i.e., linear)
